Purpose

This guide explains how we use the Exhibitor Portal in the current SentinaAI build. It is written for exhibitor users who need to review booth level intelligence, catchment engagement, competition density, heat map patterns, analytics trends, navigation, and report outputs.

The Exhibitor Portal is built to help us understand how our assigned booth is performing and what is happening in the halls around it.

Who this guide is for

We use this guide when we need to:

1. check the assigned booth and linked exhibitor profile
2. review AI confidence and competition density
3. inspect engagement heat map patterns
4. study hall level engagement trends
5. use venue navigation
6. create, edit, generate, download, preview, or delete reports

Before we begin

Before using the Exhibitor Portal, we should make sure:

- we are logged in with an exhibitor account
- the linked exhibitor ID is available in the session
- the exhibitor analytics service is running
- the main backend services are available
- report services are online if we need report generation or downloads

If services are delayed or unavailable, some cards may show empty states, older values, or temporary error banners.

Main layout

The Exhibitor Portal uses a consistent layout across its pages.

Left sidebar

The left sidebar is the main way to move through the portal. In the current build, it includes:

- Dashboard
- Heat Map
- Analytics
- Reports

- Navigation
- Settings
- Help
- Logout

The sidebar can be collapsed or expanded using the chevron button near the top.

Top header

The top header includes:

- the portal title
- the current page title
- the live date and time
- a search field for halls or events
- the signed in user card

The user card shows:

- user name
- role
- linked exhibitor
- employee ID

Top control bar

On the main exhibitor pages, the portal also shows a control bar. This bar is hidden on Reports and Navigation.

The control bar includes:

- Exhibitor ID
- Interval
- Catchment K
- MC passes
- Refresh dashboard
- Download XLSX

What these controls do

Exhibitor ID is read only and shows the linked exhibitor.

Interval changes the time bucket used by the exhibitor analytics.

Catchment K adjusts the surrounding hall catchment scope used for analysis.

MC passes changes the number used in the model inputs.

Refresh dashboard reloads the latest exhibitor analytics.

Download XLSX downloads the portal level exhibitor analytics output directly.

Settings

Settings open as an overlay. In the current build, the settings area lets us:

- change live refresh cadence
- choose the preferred report export format
- review signed in account details
- change password

Help

Help is shown in the sidebar as a separate option.

Logout

Logout clears the current session and returns us to the login page.

Dashboard

The Dashboard page is the main exhibitor overview. It is the best place to start when we want a quick picture of booth performance and nearby hall conditions.

KPI cards

At the top of the page, we see four KPI cards:

- **Assigned Booth**
- **AI Confidence**
- **Competition Density**
- **Events Linked**

Assigned Booth

This card shows the current booth code. The supporting text may also include:

- hall name
- exhibitor name
- exhibitor ID

This is the quickest way to confirm which booth is linked to the account.

AI Confidence

This card shows the current AI confidence percentage for the exhibitor view. The supporting text may also include the average uncertainty value.

This helps us understand how stable the current model output is.

Competition Density

This card shows the latest competitive density label, such as:

- High
- Medium
- Low

It also shows the competitive density score.

This is useful when we want to understand how much surrounding competition is affecting nearby attention.

Events Linked

This card shows how many event records are linked to the exhibitor. If available, it also shows the latest linked event name or event ID.

Overview panel

The Overview panel shows quick insight statements generated from the current data. These may cover:

- AI confidence
- competition density
- average catchment engagement
- linked event count

This panel is useful when we want a plain language summary instead of reading charts first.

Profile panel

The Profile panel shows the current exhibitor summary, including:

- Exhibitor
- Industry
- Country
- Average engagement

This is the quickest way to confirm the profile being used for the current view.

Heat Map page

The Heat Map page shows catchment hall engagement around the assigned booth.

What this page is for

We use this page when we want to see:

- which surrounding halls are strongest in the latest bucket
- how engagement changes over time
- which halls appear weaker or stronger across time buckets

Main panel

The page centres around the **Engagement heat map** view.

The page subtitle explains that this is based on catchment halls around the assigned booth, grouped by time bucket.

On the right side of the header, the page shows the bucket size, such as:

- 15 min buckets
- 30 min buckets
- 60 min buckets
- Live

Hall snapshot tiles

At the top of the heat map body, the page shows hall snapshot tiles. These tiles:

- list the halls in the latest bucket
- rank them by current engagement value
- use deeper colour for stronger values

This gives us a fast latest view before we read the full grid.

Heat map table

The main table includes:

- **Time** as the first column
- one column for each hall
- engagement values for every time bucket and hall combination

Each cell is colour coded to reflect intensity. Darker cells indicate stronger engagement compared with the rest of the visible range.

Legend

At the bottom of the page, a legend shows:

- Low
- High
- minimum value
- maximum value

This helps us interpret the colour scale correctly.

Empty states

If data is not ready, the page shows a message explaining that heat map data will appear once the exhibitor analytics service responds.

If the current search does not match any halls, the page shows a message saying no halls match the current search.

Analytics page

The Analytics page is the focused workspace for exhibitor trends and ranked hall performance.

What this page is for

We use this page when we want to understand:

- how catchment engagement is trending
- how surrounding competition is trending
- which halls are strongest in the latest bucket
- which summary insights matter most right now

Main panels

The page includes two top trend cards:

- **Average catchment engagement**
- **Competitive density score**

Each of these includes:

- the current headline value
- a sparkline trend chart

Hall ranking table

The Hall ranking table shows the latest bucket only. It includes:

- Hall
- Engagement

This is useful when we want to compare the latest hall values quickly without reading the full heat map table.

Quick insights panel

The Quick insights panel repeats the current plain language summaries. This helps when we want a concise interpretation of the numbers.

Navigation page

The Navigation page is used to find a route inside the venue.

What we can do here

We can:

- choose a start location
- choose an end location
- click **Find Path**
- switch **Heatmap** on or off

- switch **Avoid Crowds** on or off
- switch **Demo IoT** on or off
- review the route on the map

How to use it

1. Select the start point.
2. Select the end point.
3. Keep **Avoid Crowds** on if we want the route to favour lower crowd pressure.
4. Click **Find Path**.
5. Review the route shown on the map.

The text below the map shows either the number of route waypoints or a prompt asking us to select start and end points first.

Reports page

The Reports page is where we manage exhibitor reports that have been saved or generated.

What we can do here

We can:

- search reports
- filter by report type
- filter by date
- filter by format
- filter by status
- sort reports
- create a new report
- generate a saved draft
- edit a draft
- preview a generated PDF
- download generated files
- delete a draft or generated report

Filters

The current filters are:

- Search here
- Report Type
- Date
- Format
- Status
- Sort

Actions by report status

For **Draft** reports, the available actions are:

- Generate draft
- Edit draft
- Delete draft

For generated **PDF** reports, the available actions are:

- Download
- Preview
- Delete

For generated **XLSX** reports, the available actions are:

- Download
- Delete

Why this matters

This page lets us keep draft work separate from final output. We can save a report setup first, then generate the final file when the event, booth, and section choices are correct.

Generate Report page

The Generate Report page is where we create a new exhibitor report or edit an existing draft.

Report configuration

The page includes:

- report name
- date from
- date to
- event
- exhibitor
- booth
- included sections
- aggregation level
- custom notes
- report format

Important behaviour on this page

For the exhibitor flow:

- **Date From** and **Date To** are shown but disabled
- **Exhibitor** is read only
- **Booth** is read only
- the booth field updates after an event is selected

Current exhibitor report sections

In the current build, the Exhibitor report can include:

- Exhibitor Profile
- Booth Traffic Overview
- Visitor Engagement Analysis
- Operating Environment Analysis
- Performance Breakdown

Aggregation level

The page includes these frequency options:

- Hourly
- Daily
- Weekly
- Monthly

Custom notes

The Additional Notes section includes a text box for:

- report context
- comments
- instructions
- extra background notes

Report format

The current page allows us to choose:

- PDF
- XLSX

Main actions

At the bottom of the page, we can use:

- **Cancel** to leave without saving
- **Save Draft** to keep the current configuration for later
- **Generate** to create the final report output

Recommended way to use this page

1. Enter a clear report name.
2. Select the event.
3. Confirm that the linked exhibitor is correct.
4. Check the booth field once the event is selected.
5. Keep or adjust the included sections.
6. Choose the aggregation level.
7. Add notes if context is needed.
8. Choose PDF or XLSX.
9. Save as draft if the report needs review.
10. Generate once the setup is final.

Search, filters, and working habits

The portal uses search in a few different ways.

Header search

The top header search is used for halls or events.

This affects views such as:

- latest hall snapshot results
- linked event filtering

Report search

The Reports page has its own separate search field used for reports only.

Good working practice

To use the portal well, we should:

- start with the Dashboard page for the overall picture
- open Heat Map when we need detailed time bucket and hall level intensity
- use Analytics when we want trends and ranking in a cleaner summary view
- use Navigation when we need a route inside the venue
- use Reports when we need a shareable file or summary output
- refresh the dashboard after changing Interval, Catchment K, or MC passes so the latest view matches the selected inputs

Common issues

No heat map data appears

Check whether:

- the exhibitor analytics service is running
- the linked exhibitor ID is present in the session
- the current exhibitor has available analytics data
- the dashboard refresh has completed

No halls match the search

This usually means the current header search is filtering the hall list too tightly. Clear the search and check again.

Dashboard values do not look updated

Use **Refresh dashboard** after changing Interval, Catchment K, or MC passes.

The booth field is empty on the report page

This usually means an event has not been selected yet, or there is no assigned booth available for that exhibitor under the chosen event.

Report actions look different between rows

This is normal. Report actions change based on report status and output format.

Rule-Based Assistant

The Rule-Based Assistant is available in the Exhibitor Portal through the same assistant style panel. It opens as **Senti Exhibitor** and provides a guided workflow for exhibitors to analyse their assigned event and booth performance.

At the start of a session, the assistant greets the exhibitor by name and asks the user to choose the event they want to analyse. The assistant clearly states that the booth and dates lock automatically to the selected event assignment.

This is an important part of the Exhibitor assistant workflow. The exhibitor user does not freely set the booth and date range. These values are tied to the selected event assignment.

The assistant offers the following starting options:

- Overview
- Traffic Context
- Engagement
- Operating Environment
- Performance
- Comparison

This allows the exhibitor to begin with the specific type of booth analysis they want to review.

How the assistant is used

Once the user selects an analysis type, the assistant opens a structured form.

In the current Exhibitor flow, the form can include:

- Event
- Assignment
- Aggregation
- Start date
- End date

The selected **Event** determines the assigned booth and the allowed analysis dates.

The **Assignment** section shows the linked event, booth, hall, and zone. This is presented as a locked reference so the exhibitor can clearly see what they are analysing.

The **Start date** and **End date** are shown as locked values based on the chosen event. They are not entered manually by the exhibitor.

The user can then choose:

- Run analysis
- Back to actions

Selected booth context

The assistant also includes a **Selected booth** section in the exhibitor flow. This keeps the active booth context visible while the user moves through the analysis steps.

This is useful because the Exhibitor assistant is built around the user's own event assignment and booth performance, not around a free venue-wide query.

Quick actions

At the bottom of the assistant, there is a **Quick actions** section, following the same guided workflow style as the other dashboards.

This helps the exhibitor continue working after completing an analysis without leaving the assistant.

What this feature is for

The Rule-Based Assistant is designed to give exhibitors a simple and structured way to analyse their own booth context.

It is especially useful when the exhibitor wants to:

- review performance for a selected event
- understand booth traffic and engagement
- analyse operating conditions around the assigned booth
- compare results without manually setting the booth and event logic themselves

Current build note

This guide reflects the exhibitor pages currently wired into the build:

- Dashboard
- Heat Map
- Analytics
- Navigation
- Reports
- Generate Report
- Rule-based assistant
- Settings overlay
- Help
- Logout
