Purpose

This guide explains how we use the Operations Dashboard in the current SentinaAI build. It is written for operations managers and team members who need to monitor venue activity, review exceptions, and work across the live operational pages.

The Operations Dashboard is built to help us track live occupancy, comfort, device health, alerts, events, exhibitor activity, booth assignments, navigation, digital twin views, and operational reports.

Who this guide is for

We use this guide when we need to:

- check the live status of the venue
- investigate alerts and exceptions
- review devices and halls
- monitor events, exhibitors, and booth allocations
- use navigation and digital twin tools
- create, edit, generate, preview, download, or delete reports

Before we begin

Before using the Operations Dashboard, we should make sure:

- we are logged in with an Operations Manager account
- the backend services are running
- data feeds are available
- the edge and analytics services are updating normally

If live services are delayed or unavailable, some pages may still load but show older values, empty states, or error messages.

Main layout

The Operations Dashboard uses a consistent layout across its pages.

Left sidebar

The left sidebar is the main way to move around the platform. In the current build, the Operations section includes:

- Dashboard
- Devices
- Alerts
- Events
- Exhibitors

- Booths
- Navigation
- Digital Twin
- Reports
- Settings
- Help
- Logout

The sidebar can be collapsed or expanded using the small chevron button near the top.

Top header

The top header includes:

- the page title
- the signed in user card

Settings

Settings open as an overlay. In the current build, the Operations settings area lets us:

- change live refresh cadence
- choose the preferred report export format
- review signed in account details
- change password

Logout

Logout clears the active session and sends us back to the login page.

Dashboard home

The Dashboard page is the main live overview screen. It is the best starting point when we want a quick picture of venue conditions.

KPI cards

At the top of the page, we see four headline cards:

- **Current Occupancy**
- **Average Temperature (°C)**
- **Crowd Flow**
- **Congestion**

These cards give a quick reading of the latest live interval.

Alerts panel

The Alerts card shows alert trends. It includes a range selector so we can change the view period and check whether the alert pattern is rising, stable, or falling.

Use this panel when we need to spot operational pressure early.

Devices panel

The Devices card shows a live status breakdown of connected devices. It helps us understand whether the operational picture is supported by healthy device activity.

Comfort Index

The Comfort Index card shows a gauge for current comfort conditions. This is useful when occupancy, temperature, and environmental conditions need to be read together.

Busiest Halls

The Busiest Halls card highlights the halls with the heaviest live activity. We use it to identify pressure points quickly.

AI Operations: Live Status

This panel shows a hall by hall AI summary with these columns:

- Hall
- Occupancy
- CO₂
- Congestion
- AI Action
- Anomaly

This is useful when we want to compare hall level conditions without opening each hall separately.

AI Simulator: Trigger Crowd Surge

This tool is used for controlled simulation. We can:

- select a hall
- enter an occupancy percentage
- enter a CO₂ value
- run **Simulate Surge**

In the current build, the page also gives a note that occupancy above 75% triggers spillover. This should be treated as a testing and demonstration tool, not a live command for normal use.

Predicted Occupancy

The Predicted Occupancy chart shows forecasted occupancy behaviour after current or simulated conditions. We use it to see where hall pressure may move next.

Devices page

The Devices page is where we inspect connected assets and filter them down to a useful working list.

What we can do here

We can:

- search devices
- filter by zone
- filter by hall
- filter by type
- filter by status
- sort the list
- clear filters
- move between pages of results

Filters

The current filters are:

- Search here
- Zones
- Halls
- Types
- Status
- Sort

The hall list is dependent on the zone filter. Once we choose one or more zones, the hall options narrow down to halls inside those selected zones.

Table columns

The device table includes:

- Device ID or name
- Zone n- Hall
- Type
- Status
- other device related values depending on the returned data

When to use this page

We usually open Devices when:

- a dashboard reading looks unusual and we want to trace the source
- we want to check whether a hall has the expected devices online
- we want to narrow down issues by zone, hall, type, or status

Alerts page

The Alerts page is the working list for active and historical operational alerts.

What we can do here

We can:

- search by message, rule, zone, hall, or device
- filter by severity
- filter by status
- filter by zone
- filter by hall
- filter by rule
- sort results
- acknowledge new alerts
- resolve alerts that are still open
- open the full alert detail page

Filters

The current filters are:

- Search
- Severity
- Status
- Zone
- Hall
- Rule
- Sort

Table columns

The alerts table shows:

- detected time
- severity
- status
- rule name or rule key
- zone
- hall
- device
- trigger value and threshold
- recommended action
- action buttons

Alert actions

From the main alert list, we can use:

- **Ack** to acknowledge a new alert
- **Resolve** to mark the alert as resolved

Acknowledge is only available for alerts that are still new. Resolve is disabled when an alert is already resolved or closed.

Alert details page

Clicking an alert row opens the full alert detail screen. This page shows:

- alert ID
- root cause or rule name
- priority
- zone
- time
- description
- source
- AI confidence
- threshold
- current occupancy or trigger value
- recommended actions

Where supported by the backend, we can select one or more actions and execute them from the alert detail page.

Events page

The Events page is used to review event level information.

What we can do here

We can:

- search by event ID or event name
- filter by status
- filter by venue
- filter by date range
- sort the event list
- open an individual event record

Main columns

The table includes the core event information such as:

- event ID
- event name
- venue
- dates
- status
- expected attendance and other event level values where available

Event details page

Opening an event shows a fuller breakdown with sections for:

- event summary
- exhibitors linked to the event
- booths linked to the event

The event summary includes items such as event ID, venue, start date, end date, expected attendance, expected exhibitors, and revenue when available.

Inside the exhibitors section, we can search the linked exhibitors and click a row to open a modal with exhibitor details.

Exhibitors page

The Exhibitors page is where we review commercial and event participation data at exhibitor level.

What we can do here

We can:

- search by exhibitor ID or name
- filter by event
- filter by package tier
- filter by industry
- filter by HQ country
- filter by status
- clear filters
- open an exhibitor detail modal

Table columns

The current exhibitor list includes:

- Exhibitor
- Industry
- HQ
- Status

- Contact
- Events
- Total Paid
- Tier

Detail modal

Selecting an exhibitor opens a modal that shows:

- exhibitor ID
- industry
- HQ country
- contact name
- contact email
- contact phone
- status

This page is helpful when we need a quick operational and commercial view of who is attending and what level of package they are linked to.

Booths page

The Booths page brings together booth information and assignment status.

What we can do here

We can:

- filter by event
- search by booth or exhibitor
- filter by zone
- filter by hall
- filter by size
- filter by assigned or unassigned
- sort results
- change rows per page
- move between result pages

Filter behaviour

As with Devices, the hall filter depends on the selected zone filter. Once we pick one or more zones, the hall list updates accordingly.

Table columns

The booth table shows:

- Booth
- Zone
- Hall

- Hall Name
- Size
- Area (sqm)
- Assigned?
- Exhibitor
- Assigned At
- Assignment Status

We use this page when we need to answer operational questions such as:

- which booths are already assigned
- which booths are still open
- where a specific exhibitor is sitting
- when an assignment was made

Navigation page

The Navigation page is used for route finding inside the venue.

What we can do here

We can:

- choose a start location
- choose an end location
- click **Find Path**
- switch **Heatmap** on or off
- switch **Avoid Crowds** on or off
- switch **Demo IoT** on or off
- view the generated path on the map

How to use it

1. Select the start point.
2. Select the end point.
3. Decide whether to keep **Avoid Crowds** on.
4. Click **Find Path**.
5. Review the route shown on the map.

The text under the map shows either the number of route waypoints or a prompt telling us to choose start and end points first.

Digital Twin page

The Digital Twin page opens the digital twin experience inside the main dashboard shell.

What this page is for

We use the Digital Twin when we want a spatial view of the venue rather than a table or chart. It is useful for seeing hall layouts, occupancy patterns, and live conditions in a more visual way.

In the current build, this page is embedded through an iframe, so the exact tools available inside it depend on the digital twin service that is running.

Reports page

The Reports page is where we manage operation reports that have already been saved or generated.

What we can do here

We can:

- search reports
- filter by report type
- filter by format
- filter by status
- filter by date
- sort reports
- create a new report
- generate a saved draft
- edit a draft
- preview a generated PDF
- download generated files
- delete a draft or generated report

Filters

The current filters are:

- Search here
- Report Type
- Format
- Status
- date filter where available
- Sort

Actions by report status

For **Draft** reports, the available actions are:

- Generate draft
- Edit draft
- Delete draft

For generated **PDF** reports, the available actions are:

- Download
- Preview
- Delete

For generated **XLSX** reports, the available actions are:

- Download
- Delete

Why this matters

This page separates report preparation from report output. It helps us save work in progress first, then generate the final file once the filters and sections are correct.

Generate Report page

The Generate Report page is where we create a new operations report or edit an existing draft.

Report configuration

The page includes:

- report name
- date from
- date to
- zones
- halls
- included sections
- aggregation level
- additional notes
- report format

Current operations report sections

In the current build, the Operations report can include:

- Hall Utilization Ranking
- Event Impact Analysis
- Peak Congestion Windows
- Operational Stress Index

Filter behaviour

Zone selection controls the hall list. Once zones are selected, the hall list updates to match those zones.

Aggregation level

The page includes these frequency options:

- Hourly
- Daily
- Weekly
- Monthly

File format

The current page allows us to choose:

- PDF
- XLSX

Main actions

At the bottom of the page, we can use:

- **Cancel** to return without saving
- **Save Draft** to keep the current configuration for later
- **Generate** to create the final report output

Recommended way to use this page

1. Enter a clear report name.
2. Set the reporting date range (data is currently between 25/12/2025 and 25/01/2026).
3. Select the relevant zones.
4. Select one or more halls if needed.
5. Keep or adjust the included sections.
6. Choose the aggregation level.
7. Add notes if context is needed.
8. Choose PDF or XLSX.
9. Save as draft if the report needs review.
10. Generate once the setup is final.

Search, filters, and paging

Most list pages follow the same working pattern:

1. Use the search box first if we know the item name or ID.
2. Apply filters to narrow the list.
3. Use sort only after the list is close to what we need.
4. Move between pages as needed.
5. Clear filters when starting a fresh search.

This keeps the workflow clean and reduces the chance of missing records because an old filter was left active.

Good working practice

To use the Operations Dashboard well, we should:

- start with the Dashboard page for the overall picture
- move to Alerts when the dashboard shows abnormal conditions
- use Devices to confirm whether the issue is linked to a specific device type or location
- use Events, Exhibitors, and Booths when the issue may be event related or assignment related
- use Navigation and Digital Twin when we need a spatial view
- use Reports when a working session needs a file output or management summary

Common issues

No data on a page

Check whether:

- the backend service is running
- the correct environment URL is set
- the filters are too narrow
- the selected date range excludes the needed records

No halls appear after choosing a zone

This usually means:

- the selected zone has no mapped halls in the current filter result
- the data source did not return halls for that zone
- the zone filter needs to be cleared and selected again

Buttons are disabled on the Alerts page

This is normal in some cases:

- **Ack** is disabled if the alert is not new
- **Resolve** is disabled if the alert is already resolved or closed

Report actions look different between rows

This is also normal. Report actions change based on status and file type.

Rule-Based Assistant

The Rule-Based Assistant is available throughout the Operations Dashboard as a floating button in the bottom right corner of the screen. It can be opened from any Operations page without leaving the current view.

When opened, the assistant appears as a panel titled **Senti Operations**. The panel includes controls to expand the view, reset the current session, and close the assistant.

At the start of a session, the assistant shows a **Current analysis** chip and a guided welcome message. It asks the user to use a structured workflow to analyse live operations by zone, hall, and date range.

The assistant offers the following starting options:

- Overview
- Occupancy
- Crowd Flow
- Trends
- Hall Performance

This allows the user to begin with the type of operational question they want to answer instead of manually searching through multiple pages.

How the assistant is used

Once an analysis type is selected, the assistant opens a form for that workflow. For example, in **Crowd Flow**, the user is asked to complete the form before running the analysis.

The form can include:

- Scope
- Start date
- End date
- Compare with

The user can then choose **Run analysis** or **Back to actions**.

This creates a guided process for operational analysis rather than requiring the user to build the view manually.

Results and guided output

After the analysis runs, the assistant presents a structured result. In the current Operations flow, this can include:

- a title for the result, such as **Crowd Movement**
- a written summary of the selected filters
- inflow
- outflow
- net flow
- the busiest movement period
- a supporting chart or visual trend

This means the assistant does not only return raw figures. It also provides a short plain language summary of what the result means.

Saved views

When the assistant is expanded, a **Saved views** panel appears on the left side.

This allows the user to save an analysis and return to it later. A saved view is shown as a named card in the side panel. In the current interface, saved views can also be deleted directly from that list.

When a saved view is opened, it appears beside **Current analysis** as a chip at the top of the assistant. This makes it easy to switch between the live working session and a previously saved analysis.

Quick actions

At the bottom of the assistant, there is a collapsible **Quick actions** section.

After an analysis is completed, this section can include actions such as:

- Save this view
- Start another analysis
- Open user guide

This helps the user continue working without leaving the assistant.

What this feature is for

The Rule-Based Assistant is designed to make operational analysis easier and more structured. It helps users move from a question to a usable result in a few guided steps.

It is especially useful when the user wants to:

- review live operational conditions quickly

- compare movement or occupancy across a date range
- focus on a specific operational topic without moving across several dashboard pages
- save useful analysis views for later reference

Current build note

This guide reflects the Operations pages currently wired into the main dashboard build:

- Dashboard
- Devices
- Alerts
- Events
- Event Details
- Exhibitors
- Booths
- Navigation
- Digital Twin
- Reports
- Generate Report
- Rule-based Assistant
- Alert Details
- Settings overlay
